**NOTE**

1. All parameters NOT specially mentioned are measured at 230VAC input, rated load and 25°C of ambient temperature.
2. Ripple & noise are measured at 20kHz of bandwidth by using a 12" twisted pair-wire terminated with a 0.1uf & 47uf parallel capacitor.
3. Tolerance: includes set up tolerance, line regulation and load regulation.
4. Length of set up time is measured at first cold start. Turning ON/OFF the power supply may lead to increase of the set up time.
5. Heat sink HS1, HS2 can not be shortened.
6. Heat sink HS1 must have safety isolation distance with system case.
7. The power supply must be considered a component which will be installed into a final equipment. All the EMC tests are being executed by mounting the unit on a 360mm*360mm metal plate with 1mm of thickness. The final equipment must be re-confirmed that it still meets EMC directives. For guidance on how to perform these EMC tests, please refer to “EMI testing of component power supplies.” (as available on http://www.meanwell.com)
8. The ambient temperature derating of 3.5°C/1000m with fanless models and of 5°C/1000m with fan models for operating altitude higher than 2000m/6500ft.

## Suggested Application

1. **Backup connection for AC interruption**
   (1) Please refer to the Fig 1.1 for suggested connection.
   - The power supply charges the battery and provides energy to the load at the same time when the AC main is OK.
   - The battery starts to supply power to the load when the AC mains fails.

2. **Alarm Signal for AC OK and Battery Low**
   (1) Alarm Signal is sent out through "AC OK" & "Battery Low" pins.
   (2) An external voltage source is required for this function. The maximum applied voltage is 50V and the maximum sink current is 30mA.
   (3) Table 2.1 explains the alarm function built in the power supply
